 Goal: a theory of bidding that is robust to specification of information

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

First attempt: First price auction

- Goal: a theory of bidding that is robust to specification of information
- First attempt: First price auction
- Hold fixed underlying value distribution,
- Consider all specifications of information and equilibrium

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- Goal: a theory of bidding that is robust to specification of information
- First attempt: First price auction
- Hold fixed underlying value distribution,
- Consider all specifications of information and equilibrium

◆□▶ ◆□▶ ★□▶ ★□▶ □ のQ@

We deliver:

- Goal: a theory of bidding that is robust to specification of information
- First attempt: First price auction
- Hold fixed underlying value distribution,
- Consider all specifications of information and equilibrium
- We deliver:
  - ► A tight lower bound on the winning bid distribution

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

A tight lower bound on revenue

- Goal: a theory of bidding that is robust to specification of information
- First attempt: First price auction
- Hold fixed underlying value distribution,
- Consider all specifications of information and equilibrium
- We deliver:
  - A tight lower bound on the winning bid distribution

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ う へ つ ・

- A tight lower bound on revenue
- A tight upper bound on bidder surplus

- Goal: a theory of bidding that is robust to specification of information
- First attempt: First price auction
- Hold fixed underlying value distribution,
- Consider all specifications of information and equilibrium
- We deliver:
  - > A tight lower bound on the winning bid distribution
  - A tight lower bound on revenue
  - A tight upper bound on bidder surplus
- Other results on max revenue, min bidder surplus, min efficiency

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ う へ つ ・

Two bidders

• Pure common value  $v \sim U[0,1]$ 

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

- Two bidders
- Pure common value  $v \sim U[0,1]$
- Submit bids  $b_i \in \mathbb{R}_+$
- High bidder gets the good and pays bid

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

 $\implies$  winner's surplus is  $v - b_i$ 

- Two bidders
- Pure common value  $v \sim U[0,1]$
- Submit bids  $b_i \in \mathbb{R}_+$
- ► High bidder gets the good and pays bid ⇒ winner's surplus is v − b<sub>i</sub>
- ► Allocation of good is always efficient, total surplus 1/2

うして ふゆう ふほう ふほう うらつ

- Seller's expected revenue is  $R = \mathbb{E}[\max\{b_1, b_2\}]$
- Bidder surplus U = 1/2 R

- Two bidders
- Pure common value  $v \sim U[0,1]$
- Submit bids  $b_i \in \mathbb{R}_+$
- ► High bidder gets the good and pays bid ⇒ winner's surplus is v − b<sub>i</sub>
- ► Allocation of good is always efficient, total surplus 1/2
- Seller's expected revenue is  $R = \mathbb{E}[\max\{b_1, b_2\}]$
- Bidder surplus U = 1/2 R
- ▶ What predictions can we make about U and R in equilibrium?

- What do bidders know about the value?
- What do they know about what others know?

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

- What do bidders know about the value?
- What do they know about what others know?
- Assume beliefs are consistent with a common prior

・ロト ・四ト ・ヨト ・ヨー うへぐ

- What do bidders know about the value?
- What do they know about what others know?
- Assume beliefs are consistent with a common prior

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

Still, many possible ways to "fill in" information:

- What do bidders know about the value?
- What do they know about what others know?
- Assume beliefs are consistent with a common prior

うして ふゆう ふほう ふほう うらつ

- Still, many possible ways to "fill in" information:
  - Bidders observe nothing;
    Unique equilibrium: b<sub>1</sub> = b<sub>2</sub> = R = 1/2

- What do bidders know about the value?
- What do they know about what others know?
- Assume beliefs are consistent with a common prior
- Still, many possible ways to "fill in" information:
  - ▶ Bidders observe nothing; Unique equilibrium: b<sub>1</sub> = b<sub>2</sub> = R = 1/2

うして ふゆう ふほう ふほう うらつ

$$b_1 = b_2 = v$$
,  $R = 1/2$ 

- What do bidders know about the value?
- What do they know about what others know?
- Assume beliefs are consistent with a common prior
- Still, many possible ways to "fill in" information:
  - ▶ Bidders observe nothing; Unique equilibrium: b<sub>1</sub> = b<sub>2</sub> = R = 1/2
  - Bidders observe everything;
    b<sub>1</sub> = b<sub>2</sub> = v, R = 1/2
- > True information structure is likely somewhere in between:
  - ▶ Bidders have some information about *v*, but not perfect

うして ふゆう ふほう ふほう うらつ

But exactly how much information do they have?

- Engelbrecht-Wiggans, Milgrom, Weber (1983, EMW):
- Bidder 1 observes v, bidder 2 observes nothing

•  $b_1 = v/2$ ,  $b_2 \sim U[0, 1/2]$  and independent of v

・ロト ・ 日 ・ モート ・ 田 ・ うへで

- Engelbrecht-Wiggans, Milgrom, Weber (1983, EMW):
- Bidder 1 observes v, bidder 2 observes nothing

•  $b_1 = v/2$ ,  $b_2 \sim U[0,1/2]$  and independent of v

▶ Bidder 2 is indifferent: With a bid of  $b_2 \in [0, 1/2]$ , will win whenever  $v \le 2b_2$ 

(ロ) (型) (E) (E) (E) (O)

- Engelbrecht-Wiggans, Milgrom, Weber (1983, EMW):
- Bidder 1 observes v, bidder 2 observes nothing

•  $b_1 = v/2$ ,  $b_2 \sim U[0,1/2]$  and independent of v

▶ Bidder 2 is indifferent: With a bid of  $b_2 \in [0, 1/2]$ , will win whenever  $v \le 2b_2$ Expected value is exactly  $b_2$ !

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- Engelbrecht-Wiggans, Milgrom, Weber (1983, EMW):
- Bidder 1 observes v, bidder 2 observes nothing

•  $b_1 = v/2$ ,  $b_2 \sim U[0,1/2]$  and independent of v

▶ Bidder 2 is indifferent: With a bid of  $b_2 \in [0, 1/2]$ , will win whenever  $v \le 2b_2$ Expected value is exactly  $b_2$ !

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ う へ つ ・

▶ Bidder 1 wins with a bid of b<sub>1</sub> with probability 2b<sub>1</sub> Surplus is (v − b<sub>1</sub>)2b<sub>1</sub>

- Engelbrecht-Wiggans, Milgrom, Weber (1983, EMW):
- Bidder 1 observes v, bidder 2 observes nothing

•  $b_1 = v/2$ ,  $b_2 \sim U[0,1/2]$  and independent of v

▶ Bidder 2 is indifferent: With a bid of  $b_2 \in [0, 1/2]$ , will win whenever  $v \le 2b_2$ Expected value is exactly  $b_2$ !

▶ Bidder 1 wins with a bid of b<sub>1</sub> with probability 2b<sub>1</sub> Surplus is (v − b<sub>1</sub>)2b<sub>1</sub>

 $\implies$  optimal to bid  $b_1 = v/2!$ 

- Engelbrecht-Wiggans, Milgrom, Weber (1983, EMW):
- Bidder 1 observes v, bidder 2 observes nothing

•  $b_1=v/2$ ,  $b_2\sim U[0,1/2]$  and independent of v

- ▶ Bidder 2 is indifferent: With a bid of  $b_2 \in [0, 1/2]$ , will win whenever  $v \le 2b_2$ Expected value is exactly  $b_2$ !
- ▶ Bidder 1 wins with a bid of  $b_1$  with probability  $2b_1$ Surplus is  $(v - b_1)2b_1$  $\implies$  optimal to bid  $b_1 = v/2!$

• 
$$U_1 = \int_{v=0}^1 v(v - v/2) dv = 1/6$$
,  $U_2 = 0$ ,  $R = 1/3$ 

## How we model beliefs matters

- Welfare outcomes are sensitive to modelling of information
- Why? Optimal bid depends on distribution of others' bids, and on correlation between others' bids and values

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

### How we model beliefs matters

- Welfare outcomes are sensitive to modelling of information
- Why? Optimal bid depends on distribution of others' bids, and on correlation between others' bids and values

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ う へ つ ・

Problem: hard to say which specification is "correct"

## How we model beliefs matters

- Welfare outcomes are sensitive to modelling of information
- Why? Optimal bid depends on distribution of others' bids, and on correlation between others' bids and values

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ う へ つ ・

- Problem: hard to say which specification is "correct"
- What welfare predictions do not depend on how we model information?

#### Can we characterize minimum revenue?

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

Can we characterize minimum revenue?

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

Must be greater than zero!

- Can we characterize minimum revenue?
- Must be greater than zero!
- But seems likely to be lower than EMW
- At min R, winning bids have been pushed down "as far as they can go"
- Force pushing back must be incentive to deviate to higher bids

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- Can we characterize minimum revenue?
- Must be greater than zero!
- But seems likely to be lower than EMW
- At min R, winning bids have been pushed down "as far as they can go"
- Force pushing back must be incentive to deviate to higher bids

うして ふゆう ふほう ふほう うらつ

► In EMW, informed bidder strictly prefers equilibrium bid
- Consider symmetric equilibria in which winning bid is an increasing function β(v) of v
- Which  $\beta$  could be incentive compatible in equilibrium?

- Consider symmetric equilibria in which winning bid is an increasing function β(v) of v
- Which  $\beta$  could be incentive compatible in equilibrium?

(ロ) (型) (E) (E) (E) (O)

Consider the following uniform upward deviation:
 Whenever equilibrium bid is x < b, bid b instead</li>

- Consider symmetric equilibria in which winning bid is an increasing function β(v) of v
- Which  $\beta$  could be incentive compatible in equilibrium?
- Consider the following uniform upward deviation:
   Whenever equilibrium bid is x < b, bid b instead</li>
- Uniform deviation up to  $b = \beta(v)$  is not attractive if

うして ふゆう ふほう ふほう うらつ

loss when would have won

- Consider symmetric equilibria in which winning bid is an increasing function β(v) of v
- Which  $\beta$  could be incentive compatible in equilibrium?
- Consider the following uniform upward deviation:
   Whenever equilibrium bid is x < b, bid b instead</li>
- Uniform deviation up to  $b = \beta(v)$  is not attractive if

$$\underbrace{\frac{1}{2}\int_{x=0}^{v}(\beta(v)-\beta(x))dx}_{\text{loss when would have won}} \geq \underbrace{\frac{1}{2}\int_{x=0}^{v}(x-\beta(v))dx}_{\text{gain when would have lost}}$$

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ 三臣 - のへで

► Rearranges to

$$\beta(v) \ge \frac{1}{2v} \int_{x=0}^{v} (x+\beta(x)) dx \qquad (IC)$$

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

Rearranges to

$$\beta(v) \ge \frac{1}{2v} \int_{x=0}^{v} (x+\beta(x)) dx \qquad (IC)$$

- What is the smallest  $\beta$  subject to (IC) and  $\beta \ge 0$ ?
- ▶ Must solve (IC) with equality for all v

Rearranges to

$$\beta(v) \ge \frac{1}{2v} \int_{x=0}^{v} (x+\beta(x)) dx \qquad (IC)$$

- What is the smallest  $\beta$  subject to (IC) and  $\beta \ge 0$ ?
- Must solve (IC) with equality for all v
- Solution is

$$\underline{\beta}(v) = \frac{1}{\sqrt{v}} \int_{x=0}^{v} x \frac{1}{2\sqrt{x}} dx$$

Rearranges to

$$\beta(v) \ge \frac{1}{2v} \int_{x=0}^{v} (x+\beta(x)) dx \qquad (IC)$$

- What is the smallest  $\beta$  subject to (IC) and  $\beta \ge 0$ ?
- Must solve (IC) with equality for all v
- Solution is

$$\underline{\beta}(v) = \frac{1}{\sqrt{v}} \int_{x=0}^{v} x \frac{1}{2\sqrt{x}} dx$$
$$= \frac{v}{3}$$

## A lower bound on revenue

Induced distribution of winning bids is U[0, 1/3]

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

Revenue is 1/6

## A lower bound on revenue

- Induced distribution of winning bids is U[0, 1/3]
- Revenue is 1/6
- In fact, symmetry/deterministic winning bid are not needed

- Distribution of winning bid has to FOSD U[0, 1/3] in all equilibria under any information
- 1/6 is a global lower bound on equilibrium revenue

#### Can construct information/equilibrium that hits bound

Can construct information/equilibrium that hits bound

- Bidders get i.i.d. signals  $s_i \sim F(x) = \sqrt{x}$  on [0, 1]
- Value is highest signal
- Distribution of highest signal is U[0, 1]

Can construct information/equilibrium that hits bound

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ う へ つ ・

- Bidders get i.i.d. signals  $s_i \sim F(x) = \sqrt{x}$  on [0, 1]
- Value is highest signal
- Distribution of highest signal is U[0, 1]
- Equilibrium bid:  $\sigma_i(s_i) = s_i/3$

Can construct information/equilibrium that hits bound

ション ふゆ アメリア メリア しょうくの

- Bidders get i.i.d. signals  $s_i \sim F(x) = \sqrt{x}$  on [0, 1]
- Value is highest signal
- Distribution of highest signal is U[0, 1]
- Equilibrium bid:  $\sigma_i(s_i) = s_i/3 \ (= \underline{\beta}(s_i))$

Can construct information/equilibrium that hits bound

- Bidders get i.i.d. signals  $s_i \sim F(x) = \sqrt{x}$  on [0, 1]
- Value is highest signal
- Distribution of highest signal is U[0, 1]
- Equilibrium bid:  $\sigma_i(s_i) = s_i/3 \ (= \underline{\beta}(s_i))$
- Defer proof until general results

Argument generalizes to:

- Argument generalizes to:
- Any common value distribution!

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

- Argument generalizes to:
- Any common value distribution!
  - Any number of bidders!

- Minimum bidding is characterized by a *deterministic winning* bid given the true values

(ロ) (型) (E) (E) (E) (O)

- Argument generalizes to:
- Any common value distribution!
  - Any number of bidders!
  - Arbitrarily correlated values!!!
- Assume symmetry of value distribution for some results
- Minimum bidding is characterized by a *deterministic winning* bid given the true values
- In general model, only depends on a one-dimensional statistic of the value profile

うして ふゆう ふほう ふほう うらつ

- Argument generalizes to:
- Any common value distribution!
  - Any number of bidders!
  - Arbitrarily correlated values!!!
- Assume symmetry of value distribution for some results
- Minimum bidding is characterized by a *deterministic winning* bid given the true values
- In general model, only depends on a one-dimensional statistic of the value profile
- Bound is characterized by binding uniform upward incentive constraints

(ロ) (型) (E) (E) (E) (O)

# The plan

- Detailed exposition of minimum bidding
- Maximum revenue/minimum bidder surplus
- Restrictions on information
- Other directions in welfare space (e.g., efficiency)

#### General model

- N bidders
- Distribution of values:  $P(dv_1, \ldots, dv_N)$
- Support of marginals  $V = [\underline{v}, \overline{v}] \subseteq \mathbb{R}_+$

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

## General model

- N bidders
- Distribution of values:  $P(dv_1, \ldots, dv_N)$
- Support of marginals  $V = [\underline{v}, \overline{v}] \subseteq \mathbb{R}_+$
- An *information structure* S consists of
  - A measurable space  $S_i$  of signals for each player i,  $S = \times_{i=1}^N S_i$
  - A conditional probability measure

$$\pi: V^N \to \Delta(S)$$

ション ふゆ アメリア メリア しょうくの

# Equilibrium

 ▶ Bidders' strategies map signals to distributions over bids in [0, v̄]

$$\sigma_i:S_i\to\Delta(B)$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

Assume "weakly undominated strategies": bidder i never bids strictly above the support of first-order beliefs about v<sub>i</sub>

## Equilibrium

 Bidders' strategies map signals to distributions over bids in [0, v)

$$\sigma_i:S_i\to\Delta(B)$$

- Assume "weakly undominated strategies": bidder i never bids strictly above the support of first-order beliefs about v<sub>i</sub>
- Bidder *i*'s payoff given strategy profile  $\sigma = (\sigma_1, \ldots, \sigma_N)$ :

$$U_i(\sigma, \mathcal{S}) = \int_{v \in V} \int_{s \in S} \int_{b \in B^N} (v_i - b_i) \frac{\mathbb{I}_{b_i \ge b_j} \forall j}{|\arg\max_j b_j|} \sigma(db|s) \pi(ds|v) P(dv)$$

ション ふゆ アメリア メリア しょうくの

## Equilibrium

 Bidders' strategies map signals to distributions over bids in [0, v)

$$\sigma_i:S_i\to\Delta(B)$$

- Assume "weakly undominated strategies": bidder i never bids strictly above the support of first-order beliefs about v<sub>i</sub>
- Bidder *i*'s payoff given strategy profile  $\sigma = (\sigma_1, \ldots, \sigma_N)$ :

$$U_i(\sigma, \mathcal{S}) = \int_{v \in V} \int_{s \in S} \int_{b \in B^N} (v_i - b_i) \frac{\mathbb{I}_{b_i \ge b_j \ \forall j}}{|\arg\max_j b_j|} \sigma(db|s) \pi(ds|v) P(dv)$$

σ is a Bayes Nash equilibrium if

$$U_i(\sigma, S) \geq U_i(\sigma'_i, \sigma_{-i}, S) \ \forall i, \sigma'_i$$

ション ふゆ アメリア メリア しょうくの

## Other welfare outcomes

Bidder surplus: 
$$U(\sigma, S) = \sum_{i=1}^{N} U_i(\sigma, S)$$
  
Revenue:  $R(\sigma, S) = \int_{v \in V^N} \int_{s \in S} \int_{b \in B^N} \max_i b_i \sigma(b|s) \pi(ds|v) P(dv)$   
Total surplus:  $T(\sigma, S) = R(\sigma, S) + U(\sigma, S)$   
Efficient surplus:  $\overline{T} = \int_{v \in V} \max_i v_i P(dv)$ 

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ● < ① へ ○</p>

 As we generalize, minimum bidding continues to be characterized by a *deterministic winning bid* given values:
 <u>B</u>(v<sub>1</sub>,...,v<sub>N</sub>)

## Main result

#### Theorem (Minimum winning bids)

- 1. In any equilibrium under any information structure in which the marginal distribution of values is P, the distribution of winning bids must first-order stochastically dominate <u>H</u>.
- 2. Moreover, there exists an information structure and an efficient equilibrium in which the distribution of winning bids is exactly <u>H</u>.

うして ふゆう ふほう ふほう うらつ

#### Corollary (Minimum revenue)

Minimum revenue over all information structures and equilibria is <u>R</u>.

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

Corollary (Minimum revenue)

Minimum revenue over all information structures and equilibria is <u>R</u>.

#### Corollary (Maximum bidder surplus)

Maximum total bidder surplus over all information structures and equilibria is  $\overline{T} - \underline{R}$ .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

▶ Bidders receive independent signals s<sub>i</sub> ~ Q<sup>1/N</sup>(s<sub>i</sub>)
 ⇒ distribution of highest signal is Q(s)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- ▶ Bidders receive independent signals s<sub>i</sub> ~ Q<sup>1/N</sup>(s<sub>i</sub>)
   ⇒ distribution of highest signal is Q(s)
- Signals are correlated with values s.t.
  - Highest signal is true average lowest value, i.e.,

$$\mu(v_1,\ldots,v_n)=\max\{s_1,\ldots,s_n\}$$

- ▶ Bidders receive independent signals s<sub>i</sub> ~ Q<sup>1/N</sup>(s<sub>i</sub>)
   ⇒ distribution of highest signal is Q(s)
- Signals are correlated with values s.t.
  - Highest signal is true average lowest value, i.e.,

$$\mu(v_1,\ldots,v_n)=\max\{s_1,\ldots,s_n\}$$

Bidder with highest signal is also bidder with highest value, i.e.,

$$\arg\max_i s_i \subseteq \arg\max_i v_i$$

- ▶ Bidders receive independent signals s<sub>i</sub> ~ Q<sup>1/N</sup>(s<sub>i</sub>)
   ⇒ distribution of highest signal is Q(s)
- Signals are correlated with values s.t.

Highest signal is true average lowest value, i.e.,

$$\mu(v_1,\ldots,v_n)=\max\{s_1,\ldots,s_n\}$$

Bidder with highest signal is also bidder with highest value, i.e.,

$$\underset{i}{\operatorname{arg\,max}} s_i \subseteq \underset{i}{\operatorname{arg\,max}} v_i$$

• All bidders use the monotonic pure-strategy  $\beta(s_i)$ 

▶  $\frac{\beta}{v_i}$  is the equilibrium strategy for an "as-if" IPV model, in which  $\frac{\beta}{v_i} = s_i$ 

▲□▶ ▲圖▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

▶  $\frac{\beta}{v_i}$  is the equilibrium strategy for an "as-if" IPV model, in which  $\frac{\beta}{v_i} = s_i$ 

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

▶ IC for IPV model with independent draws from  $Q^{1/N}$ :

$$(s_i - \sigma(s_i))Q^{\frac{N-1}{N}}(s_i)$$

- ▶  $\frac{\beta}{v_i}$  is the equilibrium strategy for an "as-if" IPV model, in which  $v_i = s_i$
- ▶ IC for IPV model with independent draws from  $Q^{1/N}$ :

$$(s_i - \sigma(s_i))Q^{\frac{N-1}{N}}(s_i) \ge (s_i - \sigma(m))Q^{\frac{N-1}{N}}(m)$$

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

- ▶  $\frac{\beta}{v_i}$  is the equilibrium strategy for an "as-if" IPV model, in which  $v_i = s_i$
- ▶ IC for IPV model with independent draws from  $Q^{1/N}$ :

$$(s_i - \sigma(s_i))Q^{\frac{N-1}{N}}(s_i) \geq (s_i - \sigma(m))Q^{\frac{N-1}{N}}(m)$$

Local IC:

$$(s_i - \sigma(s_i))Q^{\frac{N-1}{N}}(ds_i) - \sigma'(s_i)Q^{\frac{N-1}{N}}(s_i) = 0$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- $\underline{\beta}$  is the equilibrium strategy for an "as-if" IPV model, in which  $\overline{v_i} = s_i$
- ▶ IC for IPV model with independent draws from  $Q^{1/N}$ :

$$(s_i - \sigma(s_i))Q^{\frac{N-1}{N}}(s_i) \geq (s_i - \sigma(m))Q^{\frac{N-1}{N}}(m)$$

Local IC:

$$(s_i - \sigma(s_i))Q^{\frac{N-1}{N}}(ds_i) - \sigma'(s_i)Q^{\frac{N-1}{N}}(s_i) = 0$$

Solution is precisely

$$\sigma(s_i) = \frac{1}{Q^{\frac{N-1}{N}}(s_i)} \int_{x=\underline{\nu}}^{s_i} x \, Q^{\frac{N-1}{N}}(dx) = \underline{\beta}(s_i)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

### Downward deviations

- Expectation of the bidder with the highest signal is  $ilde{
  u}(s_i) \geq s_i$
- Downward deviator obtains surplus

$$(\tilde{v}(s_i) - \underline{\beta}(m))Q^{\frac{N-1}{N}}(m)$$

and

$$\left(\tilde{v}(s_i) - \underline{\beta}(m)\right) Q^{\frac{N-1}{N}}(dm) - \underline{\beta}'(m)Q^{\frac{N-1}{N}}(m) \\ \geq \left(s_i - \underline{\beta}(m)\right) Q^{\frac{N-1}{N}}(dm) - \underline{\beta}'(m)Q^{\frac{N-1}{N}}(m)$$

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

#### Downward deviations

- Expectation of the bidder with the highest signal is  $\tilde{v}(s_i) \geq s_i$
- Downward deviator obtains surplus

$$(\tilde{v}(s_i) - \underline{\beta}(m))Q^{\frac{N-1}{N}}(m)$$

and

$$\left(\tilde{v}(s_i) - \underline{\beta}(m)\right) Q^{\frac{N-1}{N}}(dm) - \underline{\beta}'(m)Q^{\frac{N-1}{N}}(m) \\ \geq \left(s_i - \underline{\beta}(m)\right) Q^{\frac{N-1}{N}}(dm) - \underline{\beta}'(m)Q^{\frac{N-1}{N}}(m)$$

• Well-known that IPV surplus is single peaked: if  $m < s_i$ ,

$$\implies (s_i - \underline{\beta}(m))Q^{\frac{N-1}{N}}(dm) - \underline{\beta}'(m)Q^{\frac{N-1}{N}}(dm) \ge 0$$

Winning bids depend on avg of lowest values
 average of losing bids (since equilibrium is efficient)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Winning bids depend on avg of lowest values
   average of losing bids (since equilibrium is efficient)
- ► Suppose winning bid in equilibrium is  $\underline{\beta}(m) > \underline{\beta}(s_i)$  $\implies \mu(v) = m$  for true values v
- ► By symmetry, all permutations of v are in µ<sup>-1</sup>(m) and equally likely

► Note: Objective and constraints are *linear* in *H<sub>i</sub>* 

## Symmetry

WLOG to consider symmetric solutions in which

$$H_i(\cdot|v) = H_{\xi(i)}(\cdot|\xi(v))$$

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

for all permutations  $\xi$ 

#### Symmetry

WLOG to consider symmetric solutions in which

$$H_i(\cdot|v) = H_{\xi(i)}(\cdot|\xi(v))$$

for all permutations  $\xi$ 

▶ For example, with N = 2, can create symmetric solution:

$$egin{aligned} \widetilde{H}_1(b|v_1,v_2) &= rac{1}{2} \left( H_1(b|v_1,v_2) + H_2(b|v_2,v_1) 
ight) \ \widetilde{H}_2(b|v_1,v_2) &= rac{1}{2} \left( H_2(b|v_1,v_2) + H_1(b|v_2,v_1) 
ight) \end{aligned}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Average losing values III

- Consider a bidder who uniformly deviates up, so they always win when the equilibrium winning bid is b
- Say there is a value profile v at which b is sometimes the winning bid
- Symmetry  $\implies b$  is equally likely to be the winning bid when values are permutations of v,  $\xi(v)$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

### Average losing values III

- Consider a bidder who uniformly deviates up, so they always win when the equilibrium winning bid is b
- Say there is a value profile v at which b is sometimes the winning bid
- Symmetry  $\implies$  b is equally likely to be the winning bid when values are permutations of v,  $\xi(v)$
- Upward deviator can only control equivalence classes
   [ν] = {ξ(ν)} on which they win, and expected value on [ν] is average value

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ うらつ

But someone has to win in equilibrium...

#### Average losing values III

- Consider a bidder who uniformly deviates up, so they always win when the equilibrium winning bid is b
- Say there is a value profile v at which b is sometimes the winning bid
- Symmetry  $\implies$  b is equally likely to be the winning bid when values are permutations of v,  $\xi(v)$
- Upward deviator can only control equivalence classes
   [ν] = {ξ(ν)} on which they win, and expected value on [ν] is average value
- But someone has to win in equilibrium...
- Incremental gain from winning when you would lose in equilibrium is the average losing value given [v]:

$$\mu(\mathbf{v}) = rac{1}{N-1} \left( \sum_{i=1}^{N} \mathbf{v}_i - ext{expected winner's value} 
ight)$$

## Efficiency

Can rewrite gain from upward deviating as

$$\int_{v \in V^N} \int_{x=\underline{v}} (\mu(v) - b) \frac{N-1}{N} \sum_i H_i(dx|v) P(dv)$$

• Incentive to deviate is weaker if  $\mu(v)$  is smaller

## Efficiency

Can rewrite gain from upward deviating as

$$\int_{v \in V^N} \int_{x=\underline{v}} (\mu(v) - b) \frac{N-1}{N} \sum_i H_i(dx|v) P(dv)$$

- Incentive to deviate is weaker if  $\mu(v)$  is smaller
- $\mu(v)$  is minimized by efficient allocation

$$\mu(\mathbf{v}) = \frac{1}{N-1} \left( \sum_{i=1}^{N} v_i - \max_i v_i \right)$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

## Efficiency

Can rewrite gain from upward deviating as

$$\int_{v \in V^N} \int_{x=\underline{v}} (\mu(v) - b) \frac{N-1}{N} \sum_i H_i(dx|v) P(dv)$$

- Incentive to deviate is weaker if  $\mu(v)$  is smaller
- $\mu(v)$  is minimized by efficient allocation

$$\mu(\mathbf{v}) = \frac{1}{N-1} \left( \sum_{i=1}^{N} \mathbf{v}_i - \max_i \mathbf{v}_i \right)$$

Can always induce efficient allocation without changing H(b): If v<sub>i</sub> = max v, set

$$\widetilde{H}_i(b|v) = rac{1}{|\operatorname{\mathsf{arg\,max}} v|} \sum_{j=1}^N H_j(b|v)$$

 Only part of (IC) that depends on correlation between b and m is

$$\hat{m}(b) = \int_{m=\underline{v}}^{\overline{v}} m H(b|m) Q(dm),$$

i.e., average losing value when winning bid is less than b

- Incentive to deviate up is weaker if  $\hat{m}(b)$  is lower
- Which correlation structure minimizes  $\hat{m}(b)$ ?
- Can minimize m̂(b) pointwise by making b and m comonotonic,

i.e., the lpha lowest  $\pmb{m}$  are associated with the lpha lowest  $\pmb{b}$ 

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ うらつ

i.e., average losing value when winning bid is less than b

- Incentive to deviate up is weaker if  $\hat{m}(b)$  is lower
- Which correlation structure minimizes  $\hat{m}(b)$ ?
- Can minimize m̂(b) pointwise by making b and m comonotonic,

i.e., the lpha lowest  $\pmb{m}$  are associated with the lpha lowest  $\pmb{b}$ 

• Implies a deterministic winning bid  $\beta(m)$  s.t. for all m,

$$H(\beta(m)) = Q(m)$$

## Relaxed program III

Relaxed program is reduced to what we assumed in example:

$$\min \int_{m=\underline{v}}^{\overline{v}} f(\beta(m))Q(dm)$$

subject to  $eta(m) \geq \underline{v}$  and

$$\frac{1}{N} \int_{x=\underline{v}}^{m} (\beta(m) - \beta(x))Q(dx)$$

$$\geq \frac{N-1}{N} \int_{x=\underline{v}}^{\overline{v}} (x - \beta(m))Q(dx)$$
(IC)

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

#### Relaxed program III

Relaxed program is reduced to what we assumed in example:

subject to  $eta(m) \geq v$  and

$$\frac{1}{N} \int_{x=\underline{v}}^{m} (\beta(m) - \beta(x))Q(dx)$$

$$\geq \frac{N-1}{N} \int_{x=\underline{v}}^{\overline{v}} (x - \beta(m))Q(dx) \qquad (IC)$$

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

Minimize β(m) pointwise by β(v) = v and (IC) binding everywhere

## Relaxed program III

Relaxed program is reduced to what we assumed in example:

$$\min \int_{m=\underline{v}}^{\overline{v}} f(\beta(m))Q(dm)$$

subject to  $eta(m) \geq v$  and

$$\frac{1}{N} \int_{x=\underline{\nu}}^{m} (\beta(m) - \beta(x))Q(dx)$$

$$\geq \frac{N-1}{N} \int_{x=\underline{\nu}}^{\overline{\nu}} (x - \beta(m))Q(dx) \qquad (IC)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- ► Minimize β(m) pointwise by β(v) = v and (IC) binding everywhere
- Solution is precisely β!

# Wrapping up

- <u>*H*</u> solves the relaxed program for an arbitrary  $f(\max b)$
- Must therefore be FOSD by any equilibrium H(b)
- ► Construction attains <u>H</u>, so proof of theorem is complete

## Maximum revenue

 With pure common value, no-information and complete information induce full surplus extraction

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- Not true with idiosyncratic values:
  - No-information induces inefficiency
  - Complete information gives rents to bidders
- Nonetheless...

#### Maximum revenue

- With pure common value, no-information and complete information induce full surplus extraction
- Not true with idiosyncratic values:
  - No-information induces inefficiency
  - Complete information gives rents to bidders
- Nonetheless...

Theorem (Maximum revenue and minimum bidder surplus) For every  $\epsilon > 0$ , there exists an information structure and equilibrium such that revenue is at least  $\overline{T} - \epsilon$  and bidder surplus is at most  $\epsilon$ .
## Additional restrictions on information

- We refer to above model as unknown values: bidder need not know anything about value
- Sensible starting point in common value models

# Additional restrictions on information

- We refer to above model as unknown values: bidder need not know anything about value
- Sensible starting point in common value models
- Often, want to model values with an idiosyncratic component
- Reasonable to suppose that bidders are more informed about own value than others' values

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ うらつ

► The *known values* model: own value is known exactly

# Additional restrictions on information

- We refer to above model as unknown values: bidder need not know anything about value
- Sensible starting point in common value models
- Often, want to model values with an idiosyncratic component
- Reasonable to suppose that bidders are more informed about own value than others' values
- ► The *known values* model: own value is known exactly
- Weak dominance: players do not bid more than own value

ション ふゆ く 山 マ チャット しょうくしゃ

#### A lower bound bidder surplus

- If bid b, always win when others' values are less than b
- Lower bound on bidder surplus <u>U</u><sub>i</sub>(v<sub>i</sub>) from best responding to "worst case" in which others bid their values:

$$\underline{U}_i(v_i) = \max_b \left\{ (v_i - b) \int_{\{v_{-i} \mid \max_{j \neq i} v_j \leq b\}} P(dv_{-i} \mid v_i) \right\}$$

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ うらつ

Integrate over values to obtain an ex-ante bound <u>U</u><sub>i</sub>

Maximum revenue/minimum bidder surplus

Theorem (Known values)

1. There exists an equilibrium in which every bidder receives surplus  $\underline{U}_i$ , thus attaining minimum bidder surplus with known values.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

Maximum revenue/minimum bidder surplus

#### Theorem (Known values)

- 1. There exists an equilibrium in which every bidder receives surplus  $\underline{U}_i$ , thus attaining minimum bidder surplus with known values.
- 2. Moreover, this equilibrium is efficient, thus attaining maximum revenue with known values.

・ロト ・ 日 ・ エ ヨ ・ ト ・ 日 ・ うらつ

# Proof sketch

• Bidders with  $v_i < \max v$  see entire profile v

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

- Known they will lose to some  $b_j \ge v_i$
- $\blacktriangleright \implies \text{losers bid } b_i = v_i$

# Proof sketch

- Bidders with  $v_i < \max v$  see entire profile v
- Known they will lose to some  $b_j \ge v_i$
- $\blacktriangleright \implies \text{losers bid } b_i = v_i$
- High valuation bidder learns he has the high value
- Receives partial information about losers' values such that
  - (i) He outbids the others with probability 1
  - (ii) Indifferent between equilibrium bid and the bid that generates  $\underline{U}_i$

(ロ) (型) (E) (E) (E) (O)

Instead, bid is informative about others' values

## Known values: Minimum revenue

- Learning own value from bid is no longer an issue
- Instead, bid is informative about others' values
- Also, with unknown values, likelihood of you winning in equilibrium at a winning bid b is always 1/N
- With unknown values, likelihood may depend on b and distribution of others' values

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Known values: Minimum revenue

- Learning own value from bid is no longer an issue
- Instead, bid is informative about others' values
- Also, with unknown values, likelihood of you winning in equilibrium at a winning bid b is always 1/N
- With unknown values, likelihood may depend on b and distribution of others' values
- Example: higher winning bids occur when values are higher on average
- If equilibrium is efficient and v<sub>i</sub> is low, I am unlikely to win in equilibrium at high bids
- Increase in probability of winning from upward deviation varies with v<sub>i</sub>

## Binary known values

- Case we can solve completely:  $v_i \in \{v_L, v_H\}$
- Setting first considered by Maskin and Riley (1985)

(ロ) (型) (E) (E) (E) (O)

- v<sub>L</sub> types are in Bertrand competition
  - $\implies$  essentially always bid  $v_L$ , lose to  $v_H$

## Binary known values

- Case we can solve completely:  $v_i \in \{v_L, v_H\}$
- Setting first considered by Maskin and Riley (1985)
- *v*<sub>L</sub> types are in Bertrand competition
  ⇒ essentially always bid *v*<sub>L</sub>, lose to *v*<sub>H</sub>
- All uniform upward constraints bind
- Winning bids are higher when average value is higher

ション ふゆ く 山 マ チャット しょうくしゃ

## Binary known values

- Case we can solve completely:  $v_i \in \{v_L, v_H\}$
- Setting first considered by Maskin and Riley (1985)
- *v*<sub>L</sub> types are in Bertrand competition
  ⇒ essentially always bid *v*<sub>L</sub>, lose to *v*<sub>H</sub>
- All uniform upward constraints bind
- Winning bids are higher when average value is higher
- General known values minimum revenue is an open question

ション ふゆ く 山 マ チャット しょうくしゃ

## Other directions

We talked about max/min revenue, max/min bidder surplus

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

What about weighted sums? Minimum efficiency?

## Other directions

- We talked about max/min revenue, max/min bidder surplus
- What about weighted sums? Minimum efficiency?
- ▶ More broadly, what is the *whole set* of possible (U, R) pairs?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

(ロ) (型) (E) (E) (E) (O)

► Solved numerically for two bidder i.i.d. U[0, 1] model

# Welfare set

イロト イポト イヨト イヨト

æ

Note: Lower bound on efficiency

What can we do with this?

Applications/extensions:

- ► Many bidder limit
- Impact of reserve prices/entry fees
- Identification
- Other directions in welfare space

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## What can we do with this?

Applications/extensions:

- Many bidder limit
- Impact of reserve prices/entry fees
- Identification
- Other directions in welfare space
- Context:
  - Part of a larger agenda on robust predictions and information design
