Dirk Bergemann, Stephen Morris and Satoru Takahashi Interdependent Preferences and Strategic Distinguishability

A 3 b

- Economists assume interdependence of preferences for informational and/or psychological reasons.
- Economists model differences in beliefs as deriving from differences in priors and differences in information.

同 ト イ ヨ ト イ ヨ ト

Introduction Main Question Example Motivation Universal Preference Hierarchy Summary Main Result Outline Back to the Example and Extensions Extra Slides

- Economists assume interdependence of preferences for informational and/or psychological reasons.
- Economists model differences in beliefs as deriving from differences in priors and differences in information.
  - What are the operational (observable) content of these modelling choices?

・ 同 ト ・ ヨ ト ・ ヨ

**Motivation** Summary Outline

## 1. Interdependence

- Agent i has type  $heta_i \in [0,1]$
- Agent *i*'s valuation of an object is  $\theta_i + \gamma \sum_{i=1}^{n} \theta_i$
- Interesting mechanism design problem allocating the object "efficiently"
- Informational story: I have a signal which is more relevant about its private value to me than about its private value to you
- Psychological story: I want to own a painting that everyone (but more especially I) think is pretty
- Can we tell the difference? Do we care?

(ロ) (同) (ヨ) (ヨ)

**Motivation** Summary Outline

# 2. Priors and Information

- Sometime in the fifteen years between 1967 (Harsanyi) and 1982 (Milgrom-Stokey), economists internalized a key distinction between differences in beliefs due to differences in priors and differences due to asymmetric information.
- If you are an expert, and knowing your belief leads me to change my belief, this must be modelled as asymmetric information (even if there is no physical counterpart of your informaiton)
- Candidate operational definition of "information": something you do would lead me to change my action

- 4 同 6 4 日 6 4 日 6

#### Introduction

Main Question Example Universal Preference Hierarchy Main Result Back to the Example and Extensions Extra Slides

Motivation Summary Outline

#### This Paper: Main Result

- Reports a canonical description of interdependent preference types (universal EU preference hierarchy space)
- Gives an operational meaning to this space:
  - Two types are "strategically indistinguishable" if they have an equilibrium action in common in every "mechanism"
  - We show that two types are strategically indistinguishable if and only if they correspond to the same preference hierarchy

(4月) (1日) (日)

Motivation **Summary** Outline

#### Answers

- Operational definition of "private values": common certainty that agents' choices do not depend on others' choices (in some equilibrium)
- Without private values, no useful distinction between "beliefs" and "utility" and so
  - no operational distinction between informational and psychological interdependence
  - ② no meaning to priors versus information
- With private values, state independence separates "beliefs" and "utility"
  - interdependence is naturally interpreted as informational
  - all information structures embedded in universal preference hierarchy space

Motivation **Summary** Outline

# Related Literature 1 (preview)

- Mertens-Zamir (1985) constructed universal of higher order beliefs
  - our universal space formally isomorphic to MZ space, but removes new "redundancy" once payoffs are added
- Abreu-Matsushima (1992) identified a measurability condition necessary for virtual Bayesian implementation
  - strategic distinguishability is a re-writing of the idea of the AM measurability condition

- 4 回 ト 4 ヨト 4 ヨト

Motivation **Summary** Outline

# Related Literature 1 (preview)

- Dekel-Fudenberg-Morris (2007) showed that two types have the same rationalizable actions in all games if and only if they have the same Mertens-Zamir type
  - DFM corresponds formally to a special case of this paper with common certainty of vNM indices
- Gul-Pesendorfer (2007) constructed canonical space of interdependent preferences
  - We have incomplete information and static games/solution concepts, so cannot extract counterfactual information contained in GP types

・ロト ・同ト ・ヨト ・ヨト

Motivation Summary Outline

#### Paper Outline 1: Main Result

- Take any "Harsanyi" type space (any and all interdependence)
- ② Define strategic distinguishability of Harsanyi types
- Step 1: Remove two kinds of "decision theoretic redundancy" by mapping to "preference type space"
- Step 2: Remove "strategic redundancy" by mapping to universal preference hierarchy space
- Main result

- 4 周 ト 4 戸 ト 4 戸 ト

#### Introduction

Main Question Example Universal Preference Hierarchy Main Result Back to the Example and Extensions Extra Slides

Motivation Summary Outline

#### Paper Outline 2: Extensions

- Two types are "strategically equivalent" if they have the same equilibrium actions in every "mechanism"
- Strategic equivalence strictly more demanding than strategic indistinguishability
- Many versions of rationalizability depending on what you may believe others actions are correlated with....
- Universal preference hierarchy characterizes strategic distinguishability for all solution concepts
- Universal preference hierarchy characterizes strategic equivalence for most permissive version of rationalizability

Introduction Main Question Example Universal Preference Hierarchy Main Result Back to the Example and Extensions Extra Slides	<b>Environment</b> Mechanism Harsanyi Type Spaces Equilibrium Defining Strategic Distinguishability

#### Environment

An outside observer will see an *environment* consisting of:

- Agents 1, .., *I*
- Set of Outcomes Z (finite)
- For each player *i*, a worst outcome w<sub>i</sub> ∈ Z (relaxation will be discussed later)
- Set of Observable States  $\Theta$  (general metric space)

Introduction Main Question Example Universal Preference Hierarchy Main Result Back to the Example and Extensions Extra Slides	Environment <b>Mechanism</b> Harsanyi Type Spaces Equilibrium Defining Strategic Distinguishability

#### Mechanism

A strategic situation or mechanism is  $\mathcal{M}=\left(\left(\mathcal{A}_{i}
ight)_{i=1}^{l}$  , g
ight) where

• each  $A_i$  is a finite set of actions available to i

• 
$$A = A_1 \times \ldots \times A_l$$

• an outcome function  $g: A \times \Theta \rightarrow \Delta(Z)$ 

Environment Mechanism **Harsanyi Type Spaces** Equilibrium Defining Strategic Distinguishability

# Harsanyi Type Spaces

A Harsanyi type space  $\mathcal{T} = \left( \left( \mathcal{T}_{i}, \mathit{u}_{i}, \mathit{v}_{i} 
ight)_{i=1}^{l}, \Omega 
ight)$  where

- $\Omega$  is a set of unobservable states
- each agent *i* is characterized by
  - a set of types  $T_i$
  - an (interdependent) vNM utility index,  $u_i: Z \times T \times \Theta \times \Omega \rightarrow \mathbb{R}_+$
  - beliefs  $\nu_i : T_i \to \Delta (T_{-i} \times \Theta \times \Omega)$
- respecting worst outcome:

$$u_i(z, t, \theta, \omega) \geq u_i(w_i, t, \theta, \omega)$$

for all *i*, *z*, *t*,  $\theta$  and  $\omega$ .

Introduction Main Question Example Environment Universal Preference Hierarchy Harsanyi Type Spaces Main Result **Equilibrium** Back to the Example and Extensions Extra Slides

# Equilibrium

- $\bullet$  A pair  $(\mathcal{T},\mathcal{M})$  is a game of incomplete information
- A behavioral strategy for agent i is  $\sigma_i : T_i \rightarrow \Delta(A_i)$
- A strategy profile  $\sigma = (\sigma_i)_{i=1}^l$  is an equilibrium if, for each i and  $t_i$ ,  $\sigma_i(a_i|t_i) > 0$  only if  $a_i$  maximizes

$$\int_{\mathcal{T}_{-i}\times\Theta\times\Omega}u_{i}(g\left((a_{i},\sigma_{-i}(t_{-i})\right),\theta),(t_{i},t_{-i}),\theta,\omega)d\nu_{i}(t_{i})$$

- Equilibrium may fail to exist on whole type space but exist on a belief-closed subset.
- $E_i(t_i, T, M)$ : set of actions type  $t_i$  may play in some equilibrium on a belief-closed subset of the type space

< 同 > < 回 > < 回 > .

Environment Mechanism Harsanyi Type Spaces Equilibrium Defining Strategic Distinguishability

# Defining Strategic Distinguishability

**DEFINITION**. Types  $t_i$  (in  $\mathcal{T}$ ) and  $t'_i$  in ( $\mathcal{T}'$ ), are strategically indistinguishable if, for every mechanism  $\mathcal{M}$ , there exists some action that can be chosen by both types, i.e. for every  $\mathcal{M}$ ,

$$E_i(t_i, \mathcal{T}, \mathcal{M}) \cap E_i(t'_i, \mathcal{T}', \mathcal{M}) \neq \emptyset$$

**DEFINITION**. Type  $t_i$  and  $t'_i$  are strategically distinguishable if there exists a mechanism in which no action can be chosen by both types, i.e., for some  $\mathcal{M}^*$ 

$$\mathsf{E}_i(t_i,\mathcal{T},\mathcal{M}^*)\cap\mathsf{E}_i(t_i',\mathcal{T}',\mathcal{M}^*)=arnothing$$

• Our main result will be a characterization of strategic (in)distinguishability.

- 4 同 6 4 日 6 4 日 6

#### Example 1: Unobservable States and Outcomes

- Two detectives, 1 and 2
- Three equally likely unobservable states  $\Omega = \{I, M, A\}$ 
  - state I, suspect innocent
  - state *M*, suspect committed crime in morning
  - state A, suspect committed crime in afternoon
- Three outcomes,  $Z = \{N, C, A\}$ 
  - "no verdict" (N)
  - "conviction" (C)
  - "acquital" (A)

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

・ロト ・同ト ・ヨト ・ヨト

# Example 1: Signals and Beliefs

- Each detective *i* observes alibi  $t_i \in \{m, a\}$
- $T_1 = T_2 = \{m, a\}$
- if innocent, each signal equally likely
- if guilty, signal not "equal to" state
- no observable states ( $\Theta = \{ heta_0\})$
- (adding a little asymmetry) if suspect committed crime in the morning,  $\varepsilon > 0$  chance detective 2 misremembers the alibi as morning

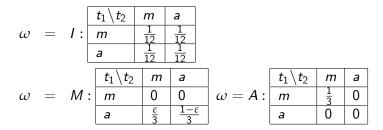

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

# Removing Decision Theoretic Redundancy 1: Integrating Out Unobserved States

• 
$$T_1 = T_2 = \{I, h\};$$

• beliefs on  $T_1 \times T_2$  consistent with common prior:

$t_1 \setminus t_2$	т	а
т	$\frac{5}{12}$	$\frac{1}{12}$
а	$\frac{1+4\varepsilon}{12}$	$\frac{5-4\varepsilon}{12}$

• (expected) payoffs

$u(C (t_1,t_2))$	т	а
m	$\frac{4}{5}$	0
а	$\frac{4\varepsilon}{1+4\varepsilon}$	$\frac{4-4\varepsilon}{5-4\varepsilon}$

Dirk Bergemann, Stephen Morris and Satoru Takahashi Interdependent Preferences and Strategic Distinguishability

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

- 4 同 🕨 - 4 目 🕨 - 4 目

#### **Behavioral Interpretation**

- types *m* or *a* correspond to different backgrounds
- conviction is more fun if like minded

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

# Removing Decision Theoretic Redundancy 2: State Dependent Expected Utility

• 
$$T_1 = T_2 = \{I, h\};$$

• beliefs on  $T_1 \times T_2$  consistent with common prior:

$t_1 \setminus t_2$	т	а
т	$\frac{1}{4}$	$\frac{1}{4}$
а	$\frac{1}{4}$	$\frac{1}{4}$

• (expected) payoffs

$u((C, A)   (t_1, t_2))$	т	а
m	4,1	0, 1
а	4ε, 1	$4 - 4\epsilon, 1$

Dirk Bergemann, Stephen Morris and Satoru Takahashi

Interdependent Preferences and Strategic Distinguishability

## Dealing with DT Redundancies: Preference Type Space

- Identify each type of detective 1 with an EU preference on AA lotteries contingent on detective 2's type, f : T<sub>2</sub> → Δ(Z)
- Type *m* of agent 1 has preference  $f \succeq f'$  if and only if

$$\begin{array}{rl} 4f\left(m\right)\left(C\right)+f\left(m\right)\left(A\right)+f\left(a\right)\left(A\right)\\ \geq & 4f'\left(m\right)\left(C\right)+f'\left(m\right)\left(A\right)+f'\left(a\right)\left(A\right)\end{array}$$

- 4 周 ト 4 戸 ト 4 戸 ト

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

・ロト ・同ト ・ヨト ・ヨト

## Canonical Representation of Types

- "First level" observation for detective 2: unconditional preferences (= marginal rate of substitution of acquital for conviction) is  $2(1 + \varepsilon)$  for type *m* and  $2(1 \varepsilon)$  for type *a*.
- "First level" observation for detective 1: unconditional preferences (= marginal rate of substitution of acquital for conviction) is 2 for both types, so cannot be distinguished.

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

< ロ > < 同 > < 回 > < 回 >

# Canonical Representation of Types

- "Second level" observation for detective 1: willingness to "pay" (in units of unconditional prob of acquital) for conviction/acquital is
  - conditional on detective 1 being type m:  $2/\frac{1}{2}$
  - conditional on detective 1 being type a:  $0/\frac{1}{2}$
- Our universal preference hierarchy space is the natural formalization of this

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

▲ □ ▶ ▲ □ ▶ ▲

# Strategic Redundancy

- Suppose  $\varepsilon = 0$ , so we have type space
- beliefs on  $T_1 \times T_2$  consistent with common prior:

$t_1 \setminus t_2$	т	а
т	$\frac{1}{4}$	$\frac{1}{4}$
а	$\frac{1}{4}$	$\frac{1}{4}$

• (expected) payoffs

$u((C, A)   (t_1, t_2))$	т	а
m	4, 1	0,1
а	0,1	4,1

Dirk Bergemann, Stephen Morris and Satoru Takahashi Interdependent Preferences and Strategic Distinguishability

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

- A - E - M

# Strategic Redundancy

 each of the two types m and a of each player is equivalent to complete information type with common certainty of mrs of 2.

$$\begin{array}{c|c} t_1 \backslash t_2 & * \\ * & 1 \end{array}$$

• (expected) payoffs

$$\begin{array}{c|c}
 u((C,A)|(t_1,t_2)) & * \\
 * & 2,1
\end{array}$$

Example Description Decision Theoretic Redundancy 1 Decision Theoretic Redundancy 2 Preference Type Spaces Universal Preference Hierarchy Space Strategic Redundancy

< ロ > < 同 > < 回 > < 回 >

# Strategic Redundancy

- consistent with our main result as there will always be a "pooling equilibrium" where types m and a behave as the complete information type
- strategic redundancy analogous to (but different from) the redundancy of Mertens and Zamir (1985) and Dekel, Fudenberg and Morris (2007).
- but suggests more demanding notion of strategic equivalence, we will return to this later

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

- 4 同 6 4 日 6 4 日 6

#### Anscombe-Aumann Acts

- Z: finite set of outcomes
- $f: X \to \Delta(Z)$ : measurable function (Anscombe-Aumann act)
- F(X): set of all acts over X

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

#### State-Dependent EU Preferences

- X finite
- State dependent EU representation:  $\nu \in \Delta(X)$ ,  $u_x \in \mathbb{R}^Z$

$$f \succeq f' \Leftrightarrow \sum_{x \in X, z \in Z} f(x)(z) u_x(z) v(x) \ge \sum_{x \in X, z \in Z} f'(x)(z) u_x(z) v(x)$$

- letting  $w \in Z$  be worst outcome, normalize for each x,  $u_x(w) = 0$  and each  $u_x \in \Delta(Z / \{w\})$
- define  $\mu \in \Delta(X \times Z / \{w\})$  by  $\mu(x, z) = u_x(z)\nu(x)$ :

$$f \succeq f' \Leftrightarrow \sum_{x \in X, z \in Z} f(x)(z) \mu(x, z) \ge \sum_{x \in X, z \in Z} f'(x)(z) \mu(x, z)$$

(4月) (1日) (日)

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

・ロト ・同ト ・ヨト ・ヨト

#### Worst Outcome State-Dependent EU Preferences

•  $P_w(X)$ : set of all binary relations  $\succeq$  over F(X) that are represented by  $\mu \in \Delta(X \times Z / \{w\})$ :

$$f \succeq f' \Leftrightarrow \int f(x)(z) d\mu(x,z) \ge \int f'(x)(z) d\mu(x,z).$$

- Anscombe-Aumann's axiomatization for state-dependent EU, replacing monotonicity with worst outcome property, i.e., z ≽ w for all z.
- We will be imposing common knowledge that (for any X) i has preferences in P<sub>i</sub>(X) ≡ P<sub>wi</sub>(X)

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

・ 同 ト ・ ヨ ト ・ ヨ ト

# Step 1: Harsanyi Type Spaces to Preference Type Spaces

- Preference Type Space  $\mathcal{T} = (\mathcal{T}_i, \pi_i)_{i \in \mathcal{I}}$ 
  - T<sub>i</sub>: measurable space of player i's types
  - $\pi_i: T_i \to P_i(\Theta \times T_{-i})$ : measurable function that maps each type to his interdependent preference

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

Step 1: Harsanyi Type Spaces to Preference Type Spaces

- Preference Type Space  $\mathcal{T} = (\mathcal{T}_i, \pi_i)_{i \in \mathcal{I}}$
- Natural mapping from Harsanyi Type Space into a Preference Type Space (removes "decision theoretic redundancy"), replacing  $(\nu_i(t_i), u_i(t_i))$  with  $\pi_i(t_i)$ , where for acts

$$f, f': \Theta \times \Omega \times T_{-i} \to \Delta(Z)$$
$$f \pi_i(t_i) f' \Leftrightarrow$$

$$\int_{T_{-i}\times\Theta\times\Omega} u_i(g((\mathbf{a}_i, f(\theta, \omega, t_{-i})), \theta), (t_i, t_{-i}), \theta, \omega)d\nu_i(t_i))$$

$$\geq \int_{T_{-i}\times\Theta\times\Omega} u_i(g((\mathbf{a}_i, f'(\theta, \omega, t_{-i})), \theta), (t_i, t_{-i}), \theta, \omega)d\nu_i(t_i))$$

- 4 同 6 4 日 6 4 日 6

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

- 4 同 6 4 日 6 4 日 6

#### Induced Preferences, Marginal Preferences

• 
$$\varphi \colon X \to Y \text{ induces } \varphi^P \colon P(X) \to P(Y)$$
 by

$$\succeq \in P_i(X), f \phi^P(\succeq) f' \Leftrightarrow f \circ \varphi \succeq f' \circ \varphi.$$

• 
$$proj_X : X \times Y \to X$$
 induces

$$marg_X = (proj_X)^P \colon P_i(X \times Y) \to P_i(X).$$

 marg<sub>X</sub> ≿ is the restriction of ≿ to acts that are independent of the Y coordinate.

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

Step 2: Preference Types Spaces to Hierarchies of Higher Order Preferences

• For simplicity, state for I = 2

• each 
$$\mathcal{T} = (T_i, \pi_i)_{i=1,2}$$
 and  $t_i \in T_i$ ,

$$\begin{aligned} \hat{\pi}_{i,1}(t_i) &= \mathsf{marg}_{\Theta} \pi_i(t_i) \in \mathcal{P}_i(\Theta), \\ \hat{\pi}_{i,2}(t_i) &= (\mathrm{id}_{\Theta} \times \hat{\pi}_{-i,1})^{\mathcal{P}}(\pi_i(t_i)) \in \mathcal{P}_i(\Theta \times \mathcal{P}_{-i}(\Theta)), \\ \hat{\pi}_{i,3}(t_i) &= (\mathrm{id}_{\Theta} \times (\hat{\pi}_{-i,1}, \hat{\pi}_{-i,2}))^{\mathcal{P}}(\pi_i(t_i)) \\ &\in \mathcal{P}_i(\Theta \times \mathcal{P}_{-i}(\Theta) \times \mathcal{P}_{-i}(\Theta \times \mathcal{P}_i(\Theta))), \end{aligned}$$

$$\hat{\pi}_{i,n}(t_i) = (\mathrm{id}_{\Theta} \times (\hat{\pi}_{-i,1}, \ldots, \hat{\pi}_{-i,n-1}))^P(\pi_i(t_i)),$$

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

#### Construction of Hierarchies

• For each 
$$\mathcal{T} = (T_i, \pi_i)_{i \in \mathcal{I}}$$
,  $i \in \mathcal{I}$ , and  $t_i \in T_i$ ,

$$\begin{aligned} \hat{\pi}_{i,1}(t_i) &= \mathsf{marg}_{\Theta} \pi_i(t_i) \in \mathcal{P}_i(\Theta), \\ \hat{\pi}_{i,2}(t_i) &= (\mathrm{id}_{\Theta} \times \hat{\pi}_{-i,1})^{\mathcal{P}}(\pi_i(t_i)) \in \mathcal{P}_i(\Theta \times \mathcal{P}_{-i}(\Theta)), \\ &\vdots \\ \hat{\pi}_{i,n}(t_i) &= (\mathrm{id}_{\Theta} \times (\hat{\pi}_{-i,1}, \dots, \hat{\pi}_{-i,n-1}))^{\mathcal{P}}(\pi_i(t_i)), \\ &\vdots \end{aligned}$$

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

・ロト ・同ト ・ヨト ・ヨト

# The Universal Type Space

- write T<sup>\*</sup><sub>i</sub> for the set of all preference hierarchies for agent i that can arise from type spaces (satisfies a "coherence" condition)
- back to I ≥ 2

**PROPOSITION**: For each agent, there is a natural preference preserving isomorphism  $\pi_i^* : T_i^* \to P_i(T_{-i}^* \times \Theta)$ 

•  $T^* = (T^*_i, \pi^*_i)_{i=1}^l$ : the universal type space.

Decision Theory Step 1: Preference Type Spaces Step 2: Induced Hierarchies

а	0, 1	4,1

Back to the Example Strategic Equivalence Rationalizability Extensions Common Certainty of "Payoffs" Conclusion

Strategic Redundancy Example

• each of the two types *m* and *a* of each detective is equivalent to complete information type with common certainty of mrs of 2.

$$egin{array}{c|c} t_1 ackslash t_2 & * \ * & 1 \end{array}$$

• (expected) payoffs

$$\begin{array}{c|c} u((C,A) | (t_1, t_2)) & * \\ * & 2,1 \end{array}$$

• Strategic redundancy analogous to (but different from) the redundancy of Mertens and Zamir (1985) and Dekel, Fudenberg and Morris (2007).

Back to the Example Strategic Equivalence Rationalizability Extensions Common Certainty of "Payoffs" Conclusion

# Strategic Non-Equivalence

• While types *m*, *a* and \* are strategically indistinguishable, it is easy construct mechanisms where they have different sets of equilibrium actions:

	m	а	opt out
m	$\delta: C$	$\delta: A$	С
а	$\delta: A$	$\delta: C$	С
opt out	С	С	С

• if 
$$rac{4}{5} < \delta < 1$$
,

- opting out is an equilibrium action for all types
- there is strict "truth-telling" eq. for "redundant" types, but opt out is unique equilibrium action for CI type

< A >

A B M A B M

Back to the Example Strategic Equivalence Rationalizability Extensions Common Certainty of "Payoffs" Conclusion

< ロ > < 同 > < 回 > < 回 >

# Strategic Equivalence

**DEFINITION**. Types  $t_i$  and  $t'_i$  are strategically indistinguishable if, for every mechanism  $\mathcal{M}$ , there exists some action that can be chosen by both types, i.e. for every  $\mathcal{M}$ ,

$$E_i(t_i, \mathcal{T}, \mathcal{M}) \cap E_i(t'_i, \mathcal{T}', \mathcal{M}) \neq \emptyset$$

**DEFINITION**. Types  $t_i$  and  $t'_i$  are *strategically equivalent* if, for every mechanism  $\mathcal{M}$ , they have the same equilibrium actions, i.e. for every  $\mathcal{M}$ ,

$$E_i(t_i, \mathcal{T}, \mathcal{M}) = E_i(t_i', \mathcal{T}', \mathcal{M})$$

• In above mechanism, types are strategically indistinguishable but not strategically equivalent.

Back to the Example Strategic Equivalence Rationalizability Extensions Common Certainty of "Payoffs" Conclusion

< ロ > < 同 > < 回 > < 回 >

# Rationalizability

- "opt out" remains also the unique interim correlated rationalizable (ICR) action (Dekel, Fudenburg and Morris (2007)) for the complete information type
- but *m* and *a* are "interim preference correlated rationalizable" for complete information type..... if we allowed "complete information type" detective 1 with unconditional mrs 2 to believe that detective 2's action is appropriately correlated with suspect's guilt.

Back to the Example Strategic Equivalence Rationalizability Extensions Common Certainty of "Payoffs" Conclusion

・ロト ・同ト ・ヨト ・ヨト

# Rest of the Paper in Words

- Introduce various notions of rationalizability for this setting: most permissive is "interim preference correlated rationalizability"
- Can discuss strategic distinguishability and strategic equivalence for different solution concepts, i.e., equilibrium and versions of rationalizability
- Preference hierarchy space characterizes strategic distinguishability for equilibrium and all versions of rationalizability
- Preference hierarchy space characterizes strategic equivalence for interim preference correlated rationalizability only

Back to the Example Strategic Equivalence Rationalizability Extensions **Common Certainty of "Payoffs"** Conclusion

# Special Case: Common Certainty of "Payoffs" (vN-M Indices)

- Universal preference hierarchy reduces to Mertens-Zamir belief hierarchy
- As Corollary of our results in this paper: the following are equivalent
  - two types have the same MZ belief hierarchy
  - two types are strategically distinguishable (under "any" solution concept)
  - two types are strategically equivalent under "interim correlated rationalizability"
- These results were shown / easily implied by Dekel-Fudenberg-Morris 06+07
- Failure of universal preference hierarchy to characterize

Main Result Back to the Example and Extensions Extra Slides Extensions Common Certainty of "Payoffs" Conclusion
--

# Conclusion

- There were strong maintained assumptions: common certainty of expected utility maximization with worst outcome
- Conceptual framework for thinking about strategic revealed preference
- Natural language for expressing operation characteristics of agents' types

- Bergemann-Morris 09
  - consider an environment without beliefs but commonly known set of possible "payoff types" for each agent
  - ask when two payoff types  $\theta_i$  and  $\theta'_i$  are "strategically distinguishable"
  - equivalent to asking if the union of rationalizable actions of all types consistent with  $\theta_i$  has a non-empty intersection with union of rationalizable actions of all types consistent with  $\theta'_i$
  - natural interpretation: when there is not too much interdependence of payoffs
